Department of Ophthalmology, Hospital of Specialties, Rabat, Morocco

A 57-year-old patient with no pathological history, who consulted urgently for a painful red eye with reduced visual acuity in her right eye, with foreign body sensation, lacrimation, and photophobia, those signs has been started three days before his admission to the emergency room.

Ophthalmological examination revealed a limited visual acuity to 2/10, slit lamp examination showed deepening nasal para-limbic ulcer with a horizontal axis, presenting a promontory edge on the central corneal side, with conjunctival hyperemia, and corneal edema.

The patient has benefited from a paraclinical evaluation which was normal.

The patient received a treatment based on topical prednisolone acetate 1% eye drop four times daily, prophylactic topical antibiotic eye drops, moxifloxacin, with preservative artificial tears.
